

### *De Nomenclatura.*

Theoriæ neotericorum insistens, denominaciones ad designanda præparata chemica tales potissimum adhibui, quæ Atomos Elementorum, corpora composita efficientium, exprimunt.

Ad indicandam duplicem proportionem Atomorum cuiuslibet Elementi, vel partis constitutivæ, usus sum, aliorum exempla secutus, adverbio numerali latino *Bis* vel *Bi*, e. g. Bichloridum Hydrargyri =  $\text{HgCl}_2$ ; Bitartras Potassæ =  $\text{KO}_2$ ,  $\text{T}_2 + \text{H}_2\text{O}$ ; Bicarbonas Sodæ =  $\text{NaO}_2 + \text{H}_2\text{O}$  etc.; sic etiam unum cum dimidio designavi, e. g. Sesquisulphuretum Stibii =  $\text{Sb}_2\text{S}_3$ ; ad indicandam dimidiad proportionem adhibui nomen numerale græcum *Dis* vel *Di*, e. g. Disulphas Chiniæ =  $2(\text{N}_2\text{C}_2\text{H}_2\text{O}_2) + \text{SO}_3 + 10\text{aq.}$ ; Disarsenis Potassæ =  $2\text{KO}_2\text{As}_2\text{O}_3$ . Dum vero proportio Atomorum major duplii fuit, usurpata sunt vocabula *Poly* vel *Super*, e. g. Polysulphuretum Stibii =  $\text{Sb}_2\text{S}_5$ ; Supersulphas Aluminæ et Potassæ =  $\text{KO}_2\text{SO}_3 + \text{Al}_2\text{O}_3, 3\text{SO}_3 + 24\text{aq.}$ ; dum e contrario proportio dimidio minor exstitit, in usum vocavi particulam *Sub*, e. g. Subnitras Bismuthi =  $4\text{BiO}_2\text{N}_2\text{O}_5 + 3\text{aq.}$ .
